## (54) ELECTRIC POWER STEERING DEVICE

## (57) Abstract:

PROBLEM TO BE SOLVED: To provide an electric power steering device for preventing a steering wheel from being heavily operated suddenly even if abnormality is generated in an electric motor.

SOLUTION: Output terminals 21A to 21E between fieldeffect transistors T1 to T10 of a FET circuit 21 are joined to exciting coils 31 via non-conductivity detecting circuit 25. The non-conductivity detecting circuit 25 detects the presence of terminal voltage of each phase of exciting coils 31 by monitoring a current passing between each of output terminals 21A to 21E and an outer edge side of each phase of exciting coils 31 and sends the results of detection to a control circuit 20. The control circuit 20 judges if a brushless motor 10 is normal or one of each of phases is nonconductive or abnormal and, if one phase is nonconductive or abnormal, a driving current passing through a brushless motor 10 is reduced as compared with a current when it is normal in a state where a clutch 9 and a relay 26 stay on.
